Fungal Strategies of Wood Decay in Trees Francis W.M.R. Schwarze, Julia Engels, Claus Mattheck

Interest in trees, whether in our streets, parks or forests, has increased considerably in the last 20 years or so. One reason for this has been the decline and dying of forests, which caused great concern about our environment during the 1980s. Because of the prominence of this event, which is now blamed on abiotic factors, it is all too easy to forget that the life of trees is also affected by a multitude of biotic factors: viruses, bacteria, fungi and animals. These may have very different relationships with trees, but are usually deleterious. The fungi play a particularly important part, and during the course of their evolution they have developed various abilities and strategies in order to obtain nutrients and energy by decomposing wood. On the other hand, the tree has 'learned' to react to external and internal infections. The various interactions between fungi and trees form the main theme of this book. In reviewing this new book I was involuntarily reminded of a work by Robert Hartig over a century ago, entitled *Die Zersetzungerscheinungen des Holzes der Nadelbäume und der Eiche in forstlicher, botanischer und chemischer Richtung*, which laid the foundation of mycological and pathological research on wood.
